

A close-up photograph showing a hand wearing a bright orange nitrile glove holding a white spray bottle with a black nozzle. The bottle is tilted, and the words "BLEACH WATER" are printed in bold black letters on its side. The spray is directed towards a light-colored, textured fabric surface, likely a Sunbrella fabric. The background is a soft, out-of-focus light gray.

# Disinfecting Sunbrella Fabrics

With the Covid-19 global pandemic, many of us have become more aware of the things we touch and how we can disinfect them to protect those we care about most.

Sunbrella's performance doesn't stop at the finish—it's engineered into the core of each fabric with a proprietary blend of fibers that are completely saturated with color—making them highly resistant to chemicals and UV light.

As a result, Sunbrella® fabrics can be cleaned and sanitized with disinfectants such as bleach and other chemicals without fear of color loss or degradation. Disinfecting or sanitizing often requires the use of strong chemicals that might damage other fabrics. However, Sunbrella fabric is proven to withstand repeated cleaning with chemicals without voiding our comprehensive warranty.

Visit [sunbrella.com/clean](https://sunbrella.com/clean) for a complete guide on cleaning instructions.
